The present invention relates to a method of delivering one or more exogenous genes for expression in an epithelial cell in the respiratory expension in an epithelial cell in the respiratory espensus designed of a mammal to give persistent expression of the gene in the epithelial cell, using a lentiviral packaging (expression vector) system. Also disclosed are (i) a recombinant lentiviral packaging system. Comprising a first nucleic acid molecule including a gag gene sequence conding a Gag protein, and a second mulcic acid molecule including a gagool gene sequence care for the charce of a frame shift which switches expression of the Gagool protein to the Gag protein in wild type lentivirus and the packaging system additionally comprises a lentiviral vector nucleic acid molecule which does not encode either the gag gene or the gagol gene is expression of the Gag protein in the wild type lentivirus. The exogenous gene is expressed in sufficient numbers of cells and amounts to provide an ameliorating effect for a respiratory condition. The exogenous gene is expressed in sufficient unmbers of cells and amounts to provide an ameliorating effect for a respiratory condition. The exogenous gene is orbitated cells, non-cillated cells, secretory cells and basal cells. The exogenous gene is orbitated cells, non-cillated cells, secretory cells and basal cells. The exogenous gene may be enably differentiated and is capalle or differentiating which descendinant lentivirus carrying an exogenous gene to the respira

The invention relates to a novel method for eliciting or inducing in a mammal an immune response directed to a virus, preferably Human immunodeficiency virus (HIV). The method comprises sequentially administering to the mammal one or more sequential doses of a recombinant plasmid vector or recombinant viral vector or its derivative, into which the nucleic acid molecules encoding all, part or a modified form of two or more antigens of the virus are incorporated, and one or more optimized or more antigens of the virus are incorporated, and one or more optimized or more antigens of the virus are incorporated, and one or more optimized or more antigens have been rendered substantially nonpathogenic. The invention further comprises: a method for treating or preventing viral pathogen; a method of eliciting or inducing an animal, an immune response directed to HIVs a vaccine capable of inducing an immune response directed to HIVs comprising the recombinant plasmid to vector or recombinant viral vector or its functional derivative; a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid, plasmid vector or recombinant viral vector constructs. The method is useful in eliciting or inducing in a mammal an immune response against HIV-I subtype AE, B or C. This sequence represents the protein of the HIV-1 hybrid isolate pNL4-3 DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eliciting or inducing in a mammal an immune response against HIV-I subtype AE, B or C by administering sequential doses of a recombinant plasmid and viral vectors containing the nucleic acid molecules encoding the HIV antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acid construct or its functional derivative comprising the plasmid vector or recombinant viral vector; a plasmid vector; a recombinant viral vector; a pharmaceutical composition comprising the

CC The invention relates to a nucleic acid vector comprising at least one CC HIV sequence operably linked to a promoter and encoding a protein that CC does not assemble into viral particles. The nucleic acid vector is useful CC in immunizing a subject against HIV infection. This sequence corresponds			Alignment Scores: 4.08e-211 Length: 1457 Pred. No.: 3741.50 Matches: 709

Novel genomic nucleic acids of non-subtype B human immunodeficiency virus type 1 useful for detecting and treating AIDS comprises a specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       number of human immunodeficiency virus (HIV) type I non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection.                                                                                                                                                                                                                                                                                                                                                                                The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B solutes. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies gainst non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         80
                                                                                                  The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. XX

New molecules comprising HIV-1 subtype isolate regulatory/accessory
PT genes, useful for manufacturing a vaccine for treating or preventing HIV

infection.

XX

Disclosure; Page 94-97; 97pp; English.

XX

The invention relates to molecules comprising HIV-1 subtype isolate
C regulatory/accessory genes (tat, nef and rev genes) and modifications and
C derivatives thereof. The invention also provides proteins encoded by such
C derivatives of the invention are useful for manufacturing vaccines
CC derivating or preventing human immunodeficiency virus (HIV) infections.

CC They are also useful in gene therapy. The present sequence is HIV-1

```
induction of specific humoral and cellular immune responses. (I) and polypeptides (II) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virus-1 (HIV-1) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype (CB' of HIV-1 so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence represents a protein encoded by the HIV-1 subtype C genome described in the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CGGCCAGATCAAGGAGGCCCTGCTGGACACCGGCGCCGACGACGACGTGCTGGAGGAGAT 482

The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tar, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV virus. These antibodies can be used in vaccines to prevent and treat HIV infection. (Updated on 12-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of the pol protein of lymphadenopathy associated virus LAV.MAL (CNCM I-641), a new virus isolate from Zaire that is responsible for diseases clinically related to AIDS. The sequence was deduced from an open reading frame (ORF) of the LAV.MAL genome (see AAV3467). 7 ORFs (see AAW72992-98) were identified. Specific peptides of the envelope glycoprotein can be useed as antigens in a claimed method for the in vitro detection of an antibody directed against LAV. The method is useful for the diagnosis of AIDS or pre-AIDS, or to detect antibodies in patients, asymptomatic carriers and in blood-related products. LAV viral antigens are also useful in vaccines. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for detecting

The present invention relates to a process for the selection of human immunodeficiency virus (HIV) subtype isolates for use in the development of a prophylactic and/or therapeutic pharmaceutical composition. The process involves selecting isolated virus or viruses with a high sequence identity to a consensus sequence and a phenotype which is associated with transmission for the particular HIV subtype. The composition can be used in the production of vaccines against HIV. The present sequence is the HIV-1 subtype C isolate Dul51 pol protein. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selecting HIV-1 subtype C isolates, which are useful in developing vaccines against HIV infection, comprises isolating viruses with high sequence identity to a consensus sequence whose phenotype is associated with the HIV subtype.

The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a nucleic acid used in the invention.

DEAV EL I (AAN80436) and LAV MA L (AAN80437) were isolated from the peripheral blood lymphocytes of patients. Different AIDS virus isolates concerned are designated by 3 letters of the patients name. Stable probes including the DNA sequences can be used for detection of the new LAV viruses or related viruses or DNA proviruses in eg. biological samples. The proteins or peptides can be used for detection of antibodies induced in vivo and present in biological fluids. The DNA can also be used for the expression of LAV viral antigens for the prodn. Of a vaccine against the detection of proteins related to the LAV viruses, partic. for diagnosis of AIDS or pre-AIDS. (Updated on 25-MAR-2003 to correct PI field.) The specification describes a method of determining the influence of variation in host genes on selection of microorganisms with protein substitutions. The method comprises typing all individuals of a substitutions. The method comprises typing all individuals of a complete of patients infected with a microorganism for at least one selected intrinsic polymorphic marker involved in the host response to the presence of the microorganism. The method is useful for examining selective pressures confronting a wide range of organisms that exhibit or viruses and virus-like particles; for examining microorganisms that have adapted to evolve rapidly, including HIV and AIDS related viruses and the hepatitis related viruses such as HCV and HBV. The method is useful for designing a vaccine to prevent or delay the emergence of drug resistance in patients treated with a particular drug specific for a microorganism or the drug affects the replication of the microorganism at the nucleotide or amino acid level. The present sequence represents a HIV pole protein, which is expected to provide optimal cytotoxic Tlymphocyte (CLL) induced therapeutic protection to the cohort examined in that study
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 200

could are an unit of the degenerative mucleotide changes in the frame shift sequence AUGUDU to reduce the chance of a frame shift which switches expression of the Gappol protein to the Gap protein in the which switches capression of the cappol protein to the Gap protein in the which switches lentivirus. The exogenous gene is expressed in sufficient numbers of cells and amounts to provide an ameliorating effect for a respiratory condition. The exogenous gene is cystic fibrosis transmembrane conductance regulator (CFTR) and the condition is cystic fibrosis ((CF) the expression of the CFTR gene is sufficient to provide a significant shift of a reduced deltapD (transepithelial potential difference) back to normal levels in the mammal). The cell is non-cterminally differentiated and is capable of differentiating into 2 or more cell classes e.g. ciliated cells, non-ciliated cells, secretory cells and basal cells. The exogenous gene may be enzymic. The gappol gene sequence has additionally degenerate nucleotide substitutions which destabilise the hairpin structure associated with the frame shift event. The gag gene is a truncation of the wild type gappol gene so that it can no longer be translated to form Gappol. The lentivirus is HIV or HIV derived. The method and recombinant lentiviral packaging system may be used for delivering nucleic acids to epithelial cells in the respiratory cued for delivering nucleic acids to epithelial cells in the respiratory The present invention relates to a method of delivering one or more exogenous genes for expression in an epithelial cell in the respiratory system of a mammal to give persistent expression of the gene in the epithelial cell, using a lentivital packaging (expression vector) system. Also disclosed are (i) a recombinant lentivital packaging system. Comprising a first nucleic acid molecule including a gag gene sequence encoding a GagPol protein (the gagpol gene sequence encoding a GagPol protein (the gagpol gene sequence has degenerative nucleotide changes in the frame shift sequence AUTUVUV to reduce the chance of a frame shift which switches expression of the Gagpol protein to the Gag protein in wild type lentivirus and the gagpol protein to the Gag protein in wild type lentivirus and the molecule which does not encode either the gag gene or the gagpol gene or combinant and (ii) a recombinant nucleic acid molecule encoding a lentiviral system of a mammal. In particular they may be used to deliver the CFTR gene for the treatment of CF. It has been found that the delivery of a recombinant lentivirus carrying an exogenous gene to the respiratory system, following the delivery of a non-toxic amount of a penetration enhancer can provide persistence of expression of a gene product. The present sequence represents modified HIV-1 GagPol protein.

cor more incorporated in a mammal, a method of vaccinating or

preventing viral infection in a mammal; a vaccine capable of inducing an

immune response directed to a virus comprising the recombinant plasmid

vector or recombinant viral vector or its functional derivative; a

concleic acid construct or its functional derivative; a

concleic acid construct or its functional derivative; a

concleic acid construct or its functional derivative; a

recombinant viral vector; a pharmaceutical composition comprising the

combinant viral vector or recombinant viral vector constructs. The

method is useful in eliciting or inducing in a mammal an immune response

adainst HIV-1 subvype AE, B Dx C. This sequence represents the protein of

the HIV-1 hybrid isolate pNL4-3 DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eliciting or inducing in a mammal an immune response against HIV-I subtype AE, B or C by administering sequential doses of a recombinant plasmid and viral vectors containing the nucleic acid molecules encoding the HIV antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ramshaw IA;

                                                                                                                   AAGGAGAAGGTGTACCTGAGCTGGGTGCCCGCCCACAAGGGCATCGGCGGCAACGAGCAG
                                                                                                                                               The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a peptide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles, useful in immunizing a subject against HIV infection.

The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. (Updated on 12-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, rev, and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV inflese infection. (Updated on 12-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                     The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. The invention relates to molecules comprising HIV-1 subtype isolate regulatory/accessory genes (tat. nef and rev genes) and modifications and derivatives thereof. The invention also provides proteins encoded by such genes. Sequences of the invention are useful for manufacturing vaccines for treating or preventing human immunodeficiency virus (HIV) infections. They are also useful in gene therapy. The present sequence is HIV-1 subtype C isolate Dui51 reverse transcriptase (RT) protein. (Updated on 23-0CT-2003 to standardise OS field)
                                             New molecules comprising HIV-1 subtype isolate regulatory/accessory genes, useful for manufacturing a vaccine for treating or preventing HIV infection.
                                                                                                                                                        Disclosure; Page 94-97; 97pp; English.

induction of specific humoral and cellular immune responses. (I) and polypeptides (II) encoded by them, are useful in pharmaceuticals, waccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virtue-1 (HIV-1) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype C/B of HIV-1 so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence represents a protein encoded by the HIV-1 subtype C genome described in the method of the invention.                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                              The present invention relates to a process for the selection of human immunodeficiency virus (HIV) subtype isolates for use in the development of a prophylactic and/or therapeutic pharmaceutical composition. The process involves selecting isolated virus or viruses with a high sequence identity to a consensus sequence and a phenotype which is associated with transmission for the particular HIV subtype. The composition can be used in the production of vaccines against HIV. The present sequence is the HIV-1 subtype C isolate Dul51 pol protein. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80
                                                                                                            number of human immunodeficiency virus (HIV) type 1 non-subtype B stolates. The sequences shown include the near full-length coding sequences from each isolate, and the env. pol, vif. vpr. vpu. gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies gainst non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection.
